

*Sexing
Bald Eagles*

(A Personal Observation)

DVOC Ornithological Study
by Debbie Beer, February 2008

Bald Eagle

Gender Differences:

Reverse Sexual Size Dimorphism apparent in Bald Eagles and most raptors.

Females up to 25% larger and heavier-bodied than male.

Size varies among individuals and geographic distributions. Northern populations are bigger and heavier than southern.

Females consistently at the larger end of the size ranges:
Body length: 28–38 in (71–96 cm),
Wingspan: 66–96 in/5.5–8 ft
(168–244 cm),
Weight: 6.6–14 lbs (3.0–6.3 kg)

Bald Eagle

Gender Differences:

Female head is proportionately larger than male.

Female bill size noticeably larger than male bill, particularly the height, from top (of upper mandible) to bottom (of lower mandible).

Culmen mean measurements from Friedman, 1950:

Male (northern): 52.5 mm

Female (northern): 54.1 mm

(Lack of data about bill height)

The advertisement features a large, detailed profile of a bald eagle's head on the right side. On the left, there are technical diagrams: a lens cross-section labeled 'Hybrid Technology' showing an 'Optical glass substrate' and an 'Aspherical lens element', and another diagram labeled 'Aspherical Lens' showing light rays converging at a 'Focus plane'. Below the diagrams is a pair of black binoculars. The text 'Original Elite Binoculars finest birding binoculars you'll ever lay eyes on.' is positioned above the binoculars. At the bottom left, the website 'nell.com' is partially visible, and at the bottom right, there is a small copyright notice '©2007 BOP'. The Bushnell 'B' logo is at the top center.
